Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

coenzyme F420-quinome oxidoreductase (EC 1.6.5.+) 56K chain - Archaeoglobus fulgidus
NyAlternate names: sarcosine oxidase alpha chain soxA homolog
C;Species: Archaeoglobus fulgidus
C;Daccession: A62284; S45665;
C;Accession: A62284; S45665;
R;Klenk, H.P.; Clayton, R.A.; Tomb, J.F.; White, O.; Nelson, K.E.; Ketchum, K.A.; Dodson

XESULT 10 169284

imap position: 5 Ajintrons: 37/2; 90/1; 113/1; 183/3; 356/3; 380/3; 428/2

Gene: CESP:F10D2.3

Graves, T.; Wohldmann, P.; Gillam, B.
ubmitted to the EMBL Data Library, September 1997
Uppescription: The sequence of C. elegans cosmid F10D2.
Uppercession: 228717

\times translated from GB/EMBL/DDBJ
\times molecule type: DNA
\times idea: 1-495 <GRA>

pothetical protein F10D2.3 - Caenorhabditis elegans

```
Cydecession: T46758

NAGATIVE REPRESSION OF GAG AND ENV PRODUCTION.

SUBCELLULAR LOCATION: Nuclear; accumulates in the nucleoli.

PTM: Phosphoproteein whose state of phosphorylation is mediated by a specific serine kinase activity present in the nucleus.

reversible oxidation-reduction of methionine sulfoxide in proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to methionine (By similarity).
-!- CATALYTIC ACTIVITY: Protein L-methionine + oxidized thioredoxin = protein L-methionine S-oxide + reduced thioredoxin.
-!- SIMILARITY: Belongs to the merA Met sulfoxide reductase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

-!- CALALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- PATHWAY: Glycolysis; sixth step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- MISCELLANEOUS: In vertebrates, three forms of this ubiquitous glycolytic enzyme are found, aldolase A in muscle, aldolase B in liver and aldolase C in brain.
-!- SIMILARITY: Belongs to class I fructose-bisphosphate aldolase
                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                           01-0CT-1996 (Rel. 34, Created)

invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7^{\rm n}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                    Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;

EEVVPXGSDYS 11

g

The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virus
                                                                                                                                                                                                                                         Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;
virucide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                       Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;

                                    /note= "Norvalyl carbonyl forming keto-amide linkage with
residue 7"
                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) proctease inhibitory activity. The peptides of the invention are alpha **Etoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"
                                                                                                                                                                                                                                                                                                                    Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus, HCV, serine protease, inhibitor, alpha-ketoamide,
virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The sequence represents a peptide compound of the invention having the peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of an endicament to treat disorders associated with NCV protease. A pharmaccutical composition comprising the peptide as an active ingredient is useful for treat disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Norvaly1 carbony1 forming keto-amide linkage with

                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                               The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) procease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV procease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

                                                                                                                                                                                                  The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                      Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            note= "Norvalyl carbonyl forming keto-amide linkage with

                                The sequence represents a peptide compound of the invention having the peptides of virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat alsorders associated with HCV protease. A pharmacceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 note= "Norvalyl carbonyl forming keto-amide linkage with

```

The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketocamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                              /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus protease.
Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Shabatica (NOV-2002) to the BMBL/GenBank/DDBJ databases.

I. Submitted (NOV-2002) to the BMBL/GenBank/DDBJ databases.

I. FUNCTION: Potential disease resistance protein.

I. FUNCTION: Potential disease resistance NB-LRR family.

PRESPIRE Subfamily.

I. SIMILARITY: Contains 3 leucine-rich (LRR) repeats.

I. SIMILARITY: Contains 1 NB-ARC domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. -i- DOMAIN: CONSISTS OF TWO DISTINCT DOMAINS; ONE IS A HEME-CONTAINING OXYGEN BINDING DOMAIN IN THE N-TERMINAL REGION AND THE OTHER IS AN FAD-CONTAINING REDUCTASE DOMAIN FOUND IN THE C-TERMINAL REGION.

-i- SIMILARITY: BELONGS TO THE GLOBIN FAMILY. TWO-DOMAIN FLAVOHEMORPOTEINS SUBFAMILY.

-i- SIMILARITY: TO A NUMBER OF FAD/NAD(P) FLAVOPROTEIN OXIDOREDUCTASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence of both chromosomes of the cholera pathogen Vibrio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (BY SIMILARITY).

 The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

 The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

RT "Intragenic recombination and diversifying selection contribute to the plant against pathogens that contain an appropriate avirulence control of the plant against pathogens that crossensitives a defense system including the hypersensitive response, which restricts the pathogen growth, In contrast to response, which restricts the pathogen growth, In contrast to response, which restricts the pathogen growth, In contrast to protein from Percohogona parasities.

CC That triggers a defense system including the hypersensitive correctes a unique RPPB gene.

CC PRESENT Subfamily.

CC MRCELLANGOUS: In cv. Columbia and cv. Di-17, this protein is not present due to an unequal crossing over between the RPPB and RPBHA Genes that creates a unique RPPB gene.

CC SIMILARITY: Contrains 1 NB-ARC domain.

 The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

Sequence 7885, Application US/09328352
Patent No. 6562958
GENERAL INPORMATION:
TITUR OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER TITUR OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTS-90-309A
CURRENT PILLING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7885
LENGTH: 1407
 Sequence 2, Application US/09760946

Sequence 2, Application US/09760946

Sequence 2, Application US/09760946

Sequence 2, Application US/09760946

GENERAL INFORMATION:
APPLICANT: Cameron, Dale R.
APPLICANT: Gandreau, Manhalie
APPLICANT: Ghiro, Elise
APPLICANT: Ghiro, Elise
APPLICANT: Ilinas-Brunet, Montee
TITLE OF INVENTION Macrosylic Peptides Active Against the Hepatitis C Virus
TILE PRINTEMENCE: 13/076-1-C1
CURRENT FILING DATE: 2001-08-23

FRIOR APPLICATION NUMBER: US 60/128,011

PRIOR FILING DATE: 1999-04-06

NUMBER OF SEQ ID NOS: 5

SOFTWARE: PatentIn version 3.1

LENGTH: 12
 OTHER INFORMATION: Substrate for recombinant HCV NS3 protease radiometric assay
 Length 1407;
 Query Match 65.4%; Score 34; DB 4; Length 140

 Sequence 2902, Application US/09540236
Patent No. 6673910
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATAR
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: POR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION WIMBER: US/09/540,236
CURRENT APPLICATION WIMBER: US/09/540,236
CURRENT FILING DATE: 2000-04-04
SEQ ID NOS: 3840
SEQ ID NOS: 3840
SEQ ID NOS: 3840
 Sequence 73, Application US/09228986

Patent No. 6159198

GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Niels
ITILE OF INVENTION: Compositions Isolated from Plant Cells
ITILE OF INVENTION: Compositions in the Modification of Plant Cell Signalling

Bacteriol. 184:2005-2018(2002).

T. GARALYTC ACTIVITY: 2 AFP + L-glutamine + CO(2) + H(2)O = 2 ADP + Dosphate + L-glutamate + carbamoyl phosphate.

T. CARALYTC ACTIVITY: 2 AFP + L-glutamine + CO(2) + H(2)O = 2 ADP + Dosphate + L-glutamate + carbamoyl phosphate.

T. PATHWAY: Arginine biosynthesis.

T. PATHWAY: Arginine biosynthesis.

T. SUBUNIT: Composed of two chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used by the large (or ammonia) chain to synthesize carbamoyl phosphate (By similarity).
